

Being Proactive

AMY YEAGER LMSW

Being Proactive Agenda

- COGNITIVE CHANGES in general
- Risks and challenges in individuals with Intellectual and Developmental Disabilities (IDD)
- Specific challenges and needs
- Proactive protocol for families, IDD agencies and other supports
- Key recommendations

COGNITIVE
CHANGES
can be caused by
MANY things

COGNITIVE CHANGES can be caused by MANY things

- Medication side effects
- Vitamin deficiencies
- Urinary tract infections
- Metabolic disorders
- Thyroid dysfunction
- Subdural hematoma
- Sleep disorders
- Sensory impairment
- Depression
- Substance abuse
- Hydrocephalus
- Vascular disease
- Brain tumors
- General infections

COGNITIVE CHANGES should always be thoroughly EVALUATED

BRAIN SCAN

CLINICAL HISTORY

PHYSICAL
EXAMINATION

SLEEP STUDY

DEMENTIA is not a specific diagnosis

ALZHEIMER'S DISEASE	60% - 80%
VASCULAR DEMENTIA/STROKE	15%
DEMENTIA WITH LEWY BODIES	15%
FRONTOTEMPORAL DEMENTIA	5%
PARKINSON'S DISEASE	5%

WHY does someone get Alzheimer's disease?

GENETICS:

- Familial variety of Alzheimer's disease approximately 10% of cases (APOE gene on chromosome 19)
- Sporadic varieties

AGE

VASCULAR DEMENTIA

HEAD
INJURY

PARKINSON'S DEMENTIA

CARDIOVASCULAR
RISK FACTORS

WOMEN AT HIGHER RISK

Importance of EARLY DETECTION

SHIFTS TO
APPROPRIATE
INTERVENTIONS

PROVIDES
OPPORTUNITY
FOR
EMOTIONAL
SUPPORT

REDUCES BIAS

ALLOWS TIME
FOR
APPROPRIATE
PLANNING

+ EARLY Stage

- Begins in the part of the brain that has to do with short term memory
- Depression early on is common
- Memory impairment very subtle, often missed by others
- Reduction of activities/involvements common
- May make comments/jokes about the forgetfulness to cover real concerns

+ As the disease progresses...

...it affects the part of the brain that impacts speech

- Word finding difficulties
- Word substitution
- Concentration errors
- Short term memory continues to worsen
- Visual spatial deficits emerge
- Challenges with numbers
- Individuals often keep note pads and other memory aides with them to manage the memory changes
- Driving issue needs to be addressed

// EARLY...HELPFUL STEPS

1. Alterations in compensatory adaptations
 - Visual cues
 - Employment accommodations
 - Adjustments in procedural task completion
2. Technology
 - Cameras
 - Safety supports (stove, medications, falls, door ajar alarms, smart locks)
3. Education
4. Emotional support

+ MIDDLE Stages

- Part of the brain that controls executive function becomes impaired
- Logic becomes circular
- Insight diminishes
- Judgment/decision making impaired
- High risk for exploitation/victimization
- Psychosis may appear—paranoia very common
- Emotional lability as center of feelings impacted

+ MIDDLE Stages continued...

- Altered sleep/wake cycle
- Loses initiation/motivation
- Sundowning
- Increasingly self absorbed
- Internal 'map' destructs

+ As the disease progresses...

- Short term memory absent, and long-term memory affected
- Frontal lobe area of the brain is impacted
- Disinhibition
- High risk for environmental changes provoked by above
- Loses the ability to filter noises
- Less interested in television
- Lower frustration threshold
- More dependent on cues from environment to convey whether one is okay

+ As the disease progresses continued...

- Misperceives things in the environment
- Sweet tooth lives
- Unable to convert physical messages to action
i.e. keeps walking/pacing even when fatigued, eats when has just eaten, etc.
- Incontinence
- Requires help with all activities of daily living

// MIDDLE...HELPFUL STEPS

5. Matching capacity and expectation
 - Support for things they can do
 - Adequate support for things they can no longer do
 - Environmental supports/transitions
6. Structured engagement
7. Active treatment for depression

+ END Stages

- Eventually the disease affects walking
- People become unsteady on their feet
- Less and less verbal, eventually mute
- Requires total care
- Can see a new or increase in behavioral issues
- Begins to have swallowing difficulties
- Often see weight loss
- Infectious process, pneumonia, etc.
is typically the demise of someone with the illness
- Seizure activity

// END...HELPFUL STEPS

8. Clarity and advocacy for individual philosophy and quality of life
9. Actively addressing depression, anxiety and other neuropsychiatric issues
10. Hospice

A photograph of two young women with glasses, smiling warmly. The woman in the foreground is wearing a yellow top and purple glasses, with her hand resting on the shoulder of the woman behind her. The woman in the background is wearing a grey top and purple glasses. The background is a soft-focus indoor setting.

KEY FACTS regarding Intellectual and Developmental Disabilities

KEY FACTS regarding IDD

Genetic link in individuals with Down syndrome (DS) – Chromosome 21 – Amyloid Protein buildup

Role of cardiovascular risk factors

Individuals with IDD other than DS may be as much as 5x more at risk for AD in older years than older adults without IDD.

(Developmental disabilities 34(6):1881-1885 · April 2013)

Role of psychiatric contributors

+ HIGHER RISK Population

- African Americans have 2x as great a risk
- Individuals with Down syndrome
- Individuals with other forms of IDD
- *Individuals with persistent mental health issues*
- *Some studies have indicated risk with early life trauma/life stress/PTSD*
- *Some studies indicate individuals with long term financial insecurity–access to health care issues*

+ Complications in recognizing early cognitive changes in IDD

- Cognitive and communication issues that impact standard testing
- Support individuals with long term comparative information not always available
 - Staff turnover
 - Individuals with IDD more likely to enter new settings when family absent or severely disabled
- Challenges in formal provider interpretation
- Symptoms can be the same with different etiology
- Co-competence in both IDD/dementia has not yet caught up with growing aging population in IDD community
- Baseline limitations
- For some, less insight about changes
- Constellation of formal supports
- May become more entrenched with same/less able to cope with changes
- Shifts in job coach involvement
- Alterations in support tasks

Something NEW

DIFFERENT BEHAVIOR

DIFFERENT RESPONSE

DIFFERENT REACTION

AGING ISSUES
in individuals with
Down syndrome

+ Aging Issues in Individuals with Down syndrome

- Seizure activity
- Sleep apnea
- Sensory deficits including risk of vision and hearing issues
- Hypothyroidism
- Increased risk of dental/gum issues
- Digestive issues such as higher risk for GI reflux and increased risk for aspiration
- Mental health issues (anxiety, depression, OCD, ADD)
- Increased risk of diabetes
- Higher risk of osteoporosis
- Higher risk of mitral valve prolapse
- Increased incidence of trauma
- Delays in pain reporting
- Long term established routine
- Communication Issues
- Higher risk of obesity

Down syndrome + DEMENTIA

- Earlier and more observable pain protocols
 - Higher risk of behavioral issues secondary to unreported pain
- Regular assessment of anti depressant and/or other psychotropics
- Attention to diet/need for special diets
- Attending to length of time in bed/positions
- Attention to indicators of past trauma/often unreported
- Historical context for “security blankets”
- Thorough diagnosis important
- Integrate long term language choices into present
- Attention to anti cholinergic medications
- Monitor wax buildup in ears/hearing issues
- Find ways to maintain long standing relationships from the Down syndrome community
- Openly celebrate successes—be consistent with past pattern of affirmation
- Shifts in job coach involvement
- Alterations in support tasks

A photograph of a middle-aged man with long brown hair, wearing a blue polo shirt and a black backpack. He is standing outdoors in a garden-like setting with flowers and a brick building in the background. The man is looking towards the camera with a slight smile. The text 'AGING ISSUES in individuals with Autism' is overlaid on the right side of the image in a white serif font.

AGING ISSUES in individuals with Autism

+ Aging Issues in Individuals with Autism

- Sensory Sensitivities—oral, tactile, auditory, and visual
- “Melt Down”
- Increased prevalence of depression, anxiety
- Social errors
- Perseveration/Fixation on certain topics or experiences
- Less able to adapt to changes in schedule/environment—Rituals
- Often limited support network, especially those with mild/moderate severity
- Literal interpretations
- Many never diagnosed
- Smaller range of interests
- Higher risk for sedentary lifestyle and consequences

Autism + DEMENTIA

- Area for calming
- Cautious medication reaction when melt downs occur
- Clear history on presence of meltdowns, triggers, how handled
- Bridge conversations with others
- Implications on activity schedule building
- Keep to schedule—
do what you say you will do
- Monitor for rise in anxiety and depression
- Know preferences for touch, sound and material
- Integrate visual cues earlier
- Know something about the topics of heightened interest—
maintain balance but integrate ‘security’ topics therapeutically
- Celebrate successes
- Shifts in job coach involvement
- Alterations in support tasks

AGING ISSUES in individuals with Cerebral Palsy

+ Aging Issues in Individuals with Cerebral Palsy

- Limitations in weight bearing—“overuse syndrome”
- Increased fall risk
- Earlier incontinence
- Higher risk of osteoarthritis/degenerative arthritis
- Risk for depression goes up with age
- Decreasing social supports
- Higher risk of vision issues

Cerebral Palsy + DEMENTIA

- Critical integration of physical therapy/movement regimen ongoing
- Monitor and treat anxiety/depression
- Bridge conversations with other—
keep the person connected
- Build activities and structure around any
sensory challenges such as vision impairment.
- Celebrate successes

A man with short dark hair, wearing a blue button-down shirt and a red apron, is smiling and holding a brown paper shopping bag. He is standing in what appears to be a cafe or grocery store, with a chalkboard menu visible in the background. The overall lighting is a cool blue tone.

Being Proactive Protocol

FOR FAMILIES

// *Being Proactive Protocol* **FOR FAMILIES**

COMPLETE NTG EDSD FORM ANNUALLY

- Individuals with Down syndrome (DS) starting at age 35
- Individuals with an IDD, other than DS, starting at age 50

PROVIDE A COPY TO

- Key IDD providers
- Successors
- Primary Care Providers
- Neurology if at point of baseline

BASELINE DEMENTIA EVALUATION

- Individuals with DS at age 35
- Individuals with an IDD other than DS, if change noted on EDSD

FOLLOW UP

- Individuals with DS, Annually after baseline
- Individuals with an IDD other than DS, annually or more often after diagnosis, depending on need and practitioner

A photograph of two men sitting at a table, looking at documents. The man on the left is wearing a grey hoodie over a yellow shirt and is holding a white marker. The man on the right is wearing a blue striped shirt and is holding a green marker. They appear to be in a collaborative meeting or workshop. The background is a blurred office setting with windows.

Being Proactive Protocol

***FOR SERVICE
PROVIDERS***

// *Being Proactive Protocol* **FOR SERVICE PROVIDERS**

MAINTAIN RECORDS OF COMPLETED NTG EDSO ASSESSMENT PROVIDED TO YOU BY FAMILIES

INCORPORATE IN STANDARD PRACTICE WITH SPECIFIC ANNUAL REVIEW

ENCOURAGE FAMILIES TO COMPLETE AND TO SHARE WITH SUCCESSORS

COMPLETION OF NTG EDSO ASSESSMENT ANNUALLY IF FAMILIES UNAVAILABLE OR HAVE LIMITED DIRECT INVOLVEMENT

- Individuals with Down syndrome (DS) starting at age 35
- Individuals with an IDD, other than DS, starting at age 50

PROVIDE A COPY TO

- Successors
- Primary Care Providers
- Neurology if at point of baseline

Being Proactive Protocol

**FOR HEALTH
CARE PROVIDERS**

// *Being Proactive Protocol* **FOR HEALTH CARE PROVIDERS**

COLLECT NTG EDSD ASSESSMENT
AS PART OF ANNUAL WELLNESS VISIT

SCAN INTO MEDICAL RECORD

BASELINE DEMENTIA EVALUATION

- Individuals with DS at age 35
- Individuals with an IDD other than DS, if change noted on EDSD

DEMENTIA EVALUATION

- Review of NTG EDSD
- Neuropsychological Testing
 - Down Syndrome Mental Status Exam (DS-MSE)
 - The Cued Recall Task
 - Completion of Dementia Questionnaire for People with Learning Disabilities (DLD)
- Sleep study as indicated
- MRI if changes noted or score of concern

// VALUE of the Protocol

OBJECTIVE ASSESSMENT

OPPORTUNITY TO ADVOCATE

PROVIDES GUIDANCE TO HEALTH CARE PROVIDERS

ALLOWS APPROPRIATE INTERVENTIONS

// CURRENT Treatments

1. Aricept
2. Exelon
3. Razadyne
4. Namenda
5. Management of psychiatric complications
6. Non pharmacological interventions

LECANEMAB (LEQEMBI™)?

NO ONE with
Down syndrome
is included in the trials

// KEY RECOMMENDATIONS in CARE and SUPPORT

- Physical activity
- Vital attention to depression/anxiety
- Communication strategies to match person
- Range of strategies to connect with others
- Interpretation of affirmation
- Benefit of consistency multiplied

- Looking holistically at the person
 - Individual presentation of the intellectual/developmental disability
 - Personality/Individual elements
 - Role of past supports/formal resources
 - Alzheimer's disease

One is not more significant than the other.

“ HOW we remember,
WHAT we remember,
and WHY we remember
form the most personal map
of our individuality.

Christine Baldwin

KU ALZHEIMER'S DISEASE RESEARCH CENTER

Research and Support Programs

1

KU ALZHEIMER'S DISEASE RESEARCH CENTER

Down Syndrome Dementia Clinic

The Down syndrome Dementia Clinic at the University of Kansas Health System is a comprehensive, multidisciplinary clinic for individuals with Down syndrome that are experiencing cognitive changes. Education and support are provided by our social work team.

ANNE ARTHUR APRN, Lead Provider

call 913.588.0983

2ND FRIDAY OF THE MONTH

Indicate you want to schedule appointment in the Down syndrome Dementia Clinic.

For IDD other than Down syndrome, call 913.588.0970 – request Anne Arthur
